Problem Statement: Abalone Age Prediction

Description:- Predicting the age of abalone from physical measurements. The age of abalone is determined by cutting the shell through the cone, staining it, and counting the number of rings through a microscope — a boring and time-consuming task. Other measurements, which are easier to obtain, are used to predict age. Further information, such as weather patterns and location (hence food availability) may be required to solve the problem.

Building a Regression Model

- 1. Download the dataset
- 2. Load the dataset into the tool.
- 3. Perform Below Visualizations.
 - · Univariate Analysis
 - · Bi-Variate Analysis
 - · Multi-Variate Analysis
- 4. Perform descriptive statistics on the dataset.
- 5. Check for Missing values and deal with them.
- 6. Find the outliers and replace them outliers
- 7. Check for Categorical columns and perform encoding.
- 8. Split the data into dependent and independent variables.
- 9. Scale the independent variables
- 10. Split the data into training and testing
- 11. Build the Model
- 12. Train the Model
- 13. Test the Model
- 14. Measure the performance using Metrics.

```
#import libraries
import numpy as np
import pandas as pd
import mathlotlih nynlot as nlt
```

```
import seaborn as sb
import plotly.express as px
```

2. Load the dataset into the tool

data = pd.read_csv('/content/drive/My Drive/abalone.csv')
